# Contents

List of Figures	ix
List of Tables	xi
Preface	xiii
Acknowledgments	xv
<b>Chapter 1 Introduction</b>	<b>1</b>
1.1. Autonomous Manufacturing System	1
1.2. Costing and Pricing	3
1.2.1. <i>Opportunity Cost</i>	4
1.2.2. <i>Opportunity Costs and Market Prices</i>	6
1.2.3. <i>Price</i>	6
<b>Chapter 2 Concepts of Costing in Automation</b>	<b>9</b>
2.1. Overview	9
2.2. Introduction and Related Works	10
2.3. Model Development	12
2.3.1. <i>Key Dimensions for Managing Automation Supply Complexity</i>	12
2.3.2. <i>Reference Automation Agent Architecture Model</i>	14
2.4. New Paradigm: The Use of Automation Resources	17
2.4.1. <i>Economic Aspects of the Automation Life Cycle</i>	17
2.4.2. <i>Maximum Benefit of the Product Life Cycle</i>	19
2.5. Data Integration Model	20
2.5.1. <i>Costs and Benefits of IS</i>	21
2.5.2. <i>Balancing Benefits against Implementation Costs</i>	21
2.6. Discussions and Concluding Remarks	22

<b>Chapter 3</b>	<b>Concepts of Pricing in Automation</b>	<b>25</b>
3.1.	Overview	25
3.2.	Introduction and Related Works	25
3.3.	Model Development	29
3.3.1.	<i>Automation Energy Pricing Model</i>	30
3.3.2.	<i>Concession Pricing Model</i>	32
3.3.3.	<i>Representative Automation Pricing Methods</i>	36
3.4.	Discussions and Concluding Remarks	41
<b>Chapter 4</b>	<b>Cost Parameters and Costing Models in Autonomous Manufacturing</b>	<b>43</b>
4.1.	Overview	43
4.2.	Introduction and Related Works	43
4.3.	Cost Accounting Concept	45
4.3.1.	<i>Documenting Cost Accounting Policies</i>	46
4.4.	Cost Object	47
4.5.	Manufacturing Costs	51
4.6.	Costing Model Development	53
4.7.	Application Study	55
4.8.	Discussions and Concluding Remarks	62
<b>Chapter 5</b>	<b>Cost Engineering in Autonomous Manufacturing</b>	<b>65</b>
5.1.	Overview	65
5.2.	Introduction and Related Works	65
5.3.	Cost Engineering	72
5.4.	Cost-Minimization/Profit Maximization	72
5.4.1.	<i>Short-run Cost Minimization</i>	74
5.4.2.	<i>Long-run Cost Minimization</i>	75
5.4.3.	<i>Application Study</i>	75
5.4.4.	<i>Cost Functions</i>	77
5.5.	Cost of Quality	81
5.5.1.	<i>Application of CoQ in Autonomous System</i>	83
5.6.	Discussions and Concluding Remarks	87

<b>Chapter 6</b>	<b>Cost and Price in Autonomous Manufacturing</b>	89
6.1.	Overview	89
6.2.	Introduction and Related Works	89
6.3.	Model Development	93
	6.3.1. <i>Time-varying Pricing</i>	94
	6.3.2. <i>Production Function</i>	97
	6.3.3. <i>Electricity Cost Function</i>	99
	6.3.4. <i>Labor Cost Function</i>	101
6.4.	Manufacturing Profit Maximization	102
6.5.	Example	103
6.6.	Discussions and Concluding Remarks	105
<b>Chapter 7</b>	<b>Pricing Models in Autonomous Manufacturing</b>	107
7.1.	Overview	107
7.2.	Introduction and Related Works	107
7.3.	Model Development and Analysis	110
7.4.	Discussions and Concluding Remarks	114
<b>Chapter 8</b>	<b>Price Optimization in Autonomous Manufacturing</b>	117
8.1.	Overview	117
8.2.	Introduction and Related Works	117
8.3.	Smart Manufacturing	121
8.4.	Pricing in Manufacturing	123
	8.4.1. <i>Profitable Selling</i>	125
	8.4.2. <i>Cost System for Advanced Manufacturing Systems</i>	126
8.5.	Estimating RWSC	127
8.6.	Application of the Cost Model	134
8.7.	Discussions and Concluding Remarks	135
	References and Further Reading	137
	Index	157

# Preface

Automation will substantially disrupt markets throughout the economy in the coming decade, ranging from construction to financial services. By understanding how technological changes will impact these markets, businesses can take advantage of the situation. Most importantly, buyers should be aware that those falling wages costs will help slow price growth in these markets, potentially providing the flexibility to delay purchasing decisions. Due to high tendency in employing high-tech machines and devices in industry and with respect to extensive consideration in automation, it is significant to investigate specific problems and challenges related to autonomous systems. However, such expensive systems require large amount of economic investment. Thus, identifying cost factors, analyzing them, and developing engineering paradigms for control and optimization need to be studied. Engineering design impacts whole-life cost of products produced. Understanding true cost of a product and the cost drivers during the design stage could guide the design process to obtain more competitive solutions. Cost engineering is concerned with cost estimation, cost control, business planning and management, profitability analysis, cost risk analysis and project management, planning, and scheduling. There are many different approaches and methods for estimating or assessing costs, all of which have advantages and disadvantages under particular circumstances. Cost estimating helps companies with decision making, cost management, and budgeting with respect to product development. It is the start of the cost management process. Cost estimates during the early stages of product development are crucial.

Also, to have more productive system and to obtain profit, appropriate pricing models should be developed to handle the operational costs in autonomous manufacturing systems. Price is one of the most flexible elements of the marketing mix, which interferes directly and in a short term over the profitability and cost effectiveness of a company. In fact, businesses can combat the destructive pricing environments that result from increased competition and globalization by implementing a more strategic pricing approach. This method provides businesses with the ability to maximize profit by providing visibility to pricing sensitivity – allowing you to maximize price in every transaction.

Therefore, both academicians and practitioners can find the book helpful. Graduate students can use the book as a course textbook or as further reading source. Industrial practitioners can learn significant concepts and applied models to be employed in real cases investigations and implementations.

Therefore, this book encompasses variety of topics in cost analysis for autonomous systems and pricing models. Different topics such as scheduling costing, agent-based costing, cost parameters of an advanced manufacturing system and operations planning with respect to cost management and cost minimization are considered in the book. Also, due to high competitive market and profit aspects, pricing concepts and models for autonomous manufacturing systems are developed. The models are novel and adapted based on autonomous manufacturing systems. Some of the distinct properties of the book are listed as follows:

- A pioneer book in cost engineering for autonomous systems.
- Introducing cost parameters, elements, and optimization models.
- Pricing models adapted for autonomous manufacturing.

This book covers several general and technical concepts involved in optimal decision making for manufacturing systems and also the use of autonomous systems as industrial automation for both researchers and executive managers. The book can be employed as a course book in graduate studies of industrial and systems engineering, operations management, logistics, etc.

Structure of the book and the materials in each chapter are further explained here.

In Chapter 1, an overview of the book and significance of the concepts considered in the book are given. In Chapter 2, the basics of costing and different cost models are explained within a scheduling problem in advanced manufacturing system. In Chapter 3, pricing models are discussed in detail and a case is investigated. Analytical studies on the performance of the pricing models in different conditions are also included. In Chapter 4, various cost parameters in manufacturing systems and costing models are reported and detailed in a case problem where specific data are extracted and a costing model is implemented. The impact of each cost parameter is also analyzed. In Chapter 5, cost minimization is discussed with respect to engineering paradigm in product design and manufacturing planning. In Chapter 6, cost/price interaction for profit modeling is handled. Profit maximization is a common goal of manufacturing needing to consider both cost and price at the same time. In Chapter 7, pricing model for advanced systems is detailed and implemented for a specific system. In Chapter 8, price optimization with respect to costs is modeled for an advanced manufacturing system. The model considers a comprehensive set of parameters and provides a generic framework for other systems.

# Acknowledgments

We would like to express our gratitude to the many people who saw us through this book; to all those who provided support, talked things over, read, wrote, offered comments, allowed us to quote their remarks and assisted in the editing, proofreading, and design.

We would like to thank Iran National Elites Foundation and Damghan University for enabling us to publish this book. Above all, we want to thank our families, who supported and encouraged us in spite of all the time it took us away from them. It was a long and difficult journey for them.

Our specific thanks to Iman Dadashpour and Ahmadreza Rostami for their warm and effective cooperation in preparing the materials of the book in different stages. Last and not least, We beg forgiveness of all those who have been with us over the course of the years and whose names we have failed to mention.

Hamed Fazlollahtabar  
Mohammad Saidi-Mehrabad
