INDEX

Note: Page numbers followed by "*n*" indicate notes.

Accelerated failure time model (AFT model), 237
"Activated entities", 340
Activators, 345–351
Adaptive elastic net GMM method, 32
Adaptive LASSO, 32
Adaptive portfolio risk management approach, 364
Adjacency matrix, 4, 29–30, 32–33
Aggregate equilibrium conditions, 120
  adding local links, 123–126
  adding self-links, 126–127
  aggregation approach, 122–123
Aggregate model specification, 6
Akaike's information criterion (AIC), 339
Allocation
  parameters, 122
  rule, 86–87
Applied microeconomics, 118
Approximation error, 9
Asian Crisis (1997–1998), 360
Assortative matching, 270
Asymptotic distribution, 66–68, 78–79
Auto loans, 317, 319
Average empty-space distance function, 178

Bank branches in Canada, 176
  data, 178–180
  disaggregated area analysis, 176
  geographical concentration, 177–178
  robustness, 188
  spatial dependence, 177
  spatial panel model, 180–188
Bank of Montreal (BMO), 179
Bank of Nova Scotia, 179
Banking network, 320
Banknote circulation, survival analysis of, 237
  clusters, 250–255
  hazard model for banknotes, 255–260
  network and spatial patterns of banknotes, 243–250
  single note inspection data, 237–243
Banknote distribution system (BNDS), 237
Banknote fitness, 243–246
Baseline models, 183–184
Bayesian econometrics, 206
Bayesian information criterion (BIC), 339
Bellman's equation, 155–156
Bias, 4
Big data, 236
Biological environment, 147
Book and market values of firm, 268–269
Bounded degree, 113
Branch density, 176, 183
Business, 118

Canada, household debt in, 316
Canadian Census, 180
Canadian household debt, 329*n*1
Canadian Imperial Bank of Commerce (CIBC), 179
Cascades effects, 274–278
Cause spillover effects, 334
Census metropolitan area level (CMA level), 188
Central Limit Theorem (CLT), 17
Centre for Economic Policy Research (CEPR), 358

Chains, 14*n*4, 20, 22
Change of basis, 28, 35, 52
Chilliwack Forest District, 161
Cholesky decomposition, 128
CISS, 346
Cluster, 178, 251–253
Clustering, 124, 251
Co-author model, 88
Co-stress, 345–351
  ID, 340, 350
Coalition-proof Nash equilibrium, 90
Coalitional games, 84
Coast Appraisal Manual (2002), 163, 172
Coauthorship
  model, 116–120, 132–134
  network, 112
Cobb–Douglas utility function, 92
Codes, 117–118
Common correlated effects estimator (CCE estimator), 182
Computational simplifications, 129, 141–142
  residual categories of types, 130–131
  restriction to observed network types, 129–130
Conditional posterior distributions, 210, 212, 226–229
Confidence region, 123, 127–128
Connectedness
  by credit market, 325–326
  by FI type, 323–325
Connections model, 87
Consumer credit(s), 317
  data, 317–318
  distributions of consumer loans, 318–320
  factors influencing FI-level interconnectedness, 326–328
  interconnectedness, 316–317
  markets, 318
  overlaping portfolio of consumer loans, 320–326
  stylized facts, 317
Consumer demographic information, 318
Consumer loans
  connectedness by credit market, 325–326
  connectedness by FI type, 323–325
  distributions, 318–320
  network construction, 320–321
  overall connectedness, 322–323
  overlaping portfolio of, 320
Contagion models, 267
Contextual effect, 5
Continuation region, 155
Controlled Markov decision problems, 146
Cooperation structure analysis, 89
Correlated effects, 28
Cosine similarity, 320, 330*n*14
Cost function, 119
CoVaR approach, 334–335, 337
Credit cards, 317–318
Credit default swap (CDS), 352–356
Credit market, connectedness by, 325–326
Credit unions, 329*n*10
Cross-holding, 267, 270
  matrix and values of organizations, 270–272
Cross-sectional sample selection models (*see also* Social interactions models)
  econometric model, 207–209
  Markov-chain Monte Carlo estimation, 213
  Monte Carlo evidence, 213–221
  posterior inference, 209–212
Cross-shareholding relationships, 266–267
Cross-validation, 338–339
Cycle duration, 243–246

Data augmentation, 230–231
Data generating process, 70–75
Data sources
  method, 171–173
  output, 173–174

Dependency matrix, 272
Digital elevation model (DEM), 156–157
Directed graph, 86
Disaggregated area analysis, 176
Disassortative mixing, 270
Disparity filter, 321–322
Distance
  distance-based measure, 179
  function, 251
Disturbance processes, 208
Diversification, 269–270
Division of Financial Stability, 363
Doğan and Taşpinar sampling (DT sampling), 211, 215, 221
Domestic systemically important banks (DSIBs), 316–319
Dot-Com bubble implosion, 350
Double machine learning, 258
Durbin spatial model (DSM), 181
Dynamic demand model, 30
Dynamic geographical information system, 146

Econometric model, 207–209
Economic
  applications in FRM, 343–364
  shock, 334
  tail risk management, 336
Edge effects, 173
Efficiency, 11
  efficiency–stability tension, 91
Eigenvalues, 34
Elastic net method, 237, 257
Elevated household debt level, 316
Endogenous effects, 5, 28
Endowment realization, 104
Entry and exit, 177
Equal-weighted measure of interconnectedness, 327–328
Estimates, 307–310
Estimation methods, 30, 112
EUCALLOCATION (ArcInfo function), 173
Euclidean distance, 330*n*14
Euro Area policy makers, 352
European Central Bank (ECB), 190*n*6
EuroStoxx 50 Volatility Index (VSTOXX), 346
Exogenous effects, 28
Expected utility
  for *n*-member market, 104–105
  for unreliable complete n-network, 106–107

Faustmann's rent, 151
Faustmann–Marshall–Pressler solution (FMP solution), 150–152
  criticisms, 152–153
Federal *Bank Act*, 329*n*10
Financial contagion, 266
  book and market values of firm, 268–269
  cascades effects, 274–278
  effect of cascades of failures, 269
  data description, 270–272
  diversification, integration, and homophily, 269–270
  industry collapse, 278–284
  literature review, 267
  model, 268–270
  network structure, 273–274
  results, 273–284
Financial crisis (2008), 336, 362
Financial institutes/institutions (FIs), 236–237, 316, 334, 340–341, 329*n*4
  connectedness by, 323–325
  factors influencing FI-level interconnectedness, 326–328
  interconnectedness of, 320–321, 324
  secondary FIs, 324
Financial Institution File (FIF), 178
  cleaning, 203–204
Financial markets, 336, 345, 362–363
Financial networks, 267
Financial risk meter (FRM), 334–335, 340
  co-stress, activators and network dynamics, 345–351

computational characteristics, 342–343
and credit default swaps, 352–356
data and computational characteristics, 340
data compilation, 341–342
economic applications, 343
financial institutions, 340–341
implications and extensions, 362–364
modeling framework, 336–340
as predictor of recessions, 356–362
preparation, estimation and reporting algorithm steps, 344
SRM, 351–352
systemic risk measure framework, 336
Financial service companies, 317
Financial stability, 295, 316
Finite payoff depth, 113
Firms, 265–266
Fixed effect elimination, 35
Fixed-coefficient production function, 148–149
Forward Sortation Areas (FSAs), 176
Fraser Timber Supply Area (FTSA), 161
Friendship model, 114–116, 122–123
simulation, 131–132
FRM@Americas, 335, 340, 342, 345, 347–348
FRM macroeconomic risk factors in, 343
FRM@Europe, 340, 342, 345, 347–348
for equity markets, 335
FRM macroeconomic risk factors in, 343
FRM@iTraxx, 356
Eu Senior financials adjacency matrix, 357
Eu Senior financials constituent network total degree of centrality, 359
spillover channel, 358
General risk market movement assessment, 336
Generalized approximate cross-validation criterion (GACV), 334
Generalized cross-validation method, 339
Generalized method of moments (GMM), 190*n*10
Generic neighborhood effects model, 181–182
Geographic concentrations, 176–178
Geographic information system (GIS), 156–159
Gibbs sampler, 230
Gibbs sampling of parameters of interest, 210–212
Google Trends, 335
Graph, 85–86
Graph-restricted game, 88
Gross domestic product (GDP), 335
Group formation theories, 84
Group-specific fixed effects
models with, 35–37, 41–45
models without, 38–41

Hausman specification test, 185
Hazard model for banknotes, 255–260
Heckman models, 232–234
Herfindahl–Hirschman Index (HHI), 319, 327, 330*n*12
Heterogeneous peer effects, network model with, 5–6
Heterophilic vertices, 72
High co-stress entities, 350
High-dimensional financial network, 336
Home equity lines of credit (Heloc), 318–319
Homophily, 269–270
principle of social network, 62
vertices, 71
Household
debt in Canada, 316
indebtedness, 316
Hyper-cube, 128

Identification, 299–301
Industrial concentrations, 176
Information Management System (IMS), 236
Institutional distress, 334
Integration, 268–270
Interbank networks, 306
Interconnectedness, 316–317
  of FIs, 320–321
Interpersonal contacts, 84
Inventory management system (IMS), 238
  structure of IMS data set, 238–241
Isomorphic subgraphs, 113

Jacobian matrix, 55
JOINITEM (ArcInfo function), 173
Jordan block, 51
Jordan canonical form, 44–45, 51

k-core decomposition algorithm, 328*n*7
k-fold cross-validation method, 339
K-means clustering method, 251
Kaplan–Meier estimator (KM estimator), 255–256

*L*1-norm quantile linear regression, 334
LASSO, 32
  method, 339
  penalization parameter, 337
Latent variables
  data augmentation, 230–231
  deriving conditional distributions of blocks, 225–226
  sampling vector of, 210–211
Law of large numbers (LLN), 178
Leave-one-out cross-validation method, 339
Leontief
  production function, 148
  technology, 149
Likelihood, 210
Linderberg central limit theorem, 67
Linear algebra
  change of basis, 52
  Jordan canonical form, 51
Linear independence of matrices, 29–30
Linear quantile Lasso regression, 337
Linear regression model, 327
Linear-in-means model, 4, 14*n*5
Lines of credit, 317
Link-based SAR, 294, 299
  2SLS estimation, 301–303
  estimates, 310
  identification, 299–301
Linkage costs, 97–98
Loan types, 317
Local economies, 118
Local identification of parameters and Eigenvalues, 57–59
Logistic regression model, 336
Long-term refinancing operations (LTROs), 308
Lumber production, 148–149
Lumber recovery factor (LRF), 149

Machine learning techniques, 112
Macroeconomics, 118
Macroprudential policy making., 362
Macroprudential Research Network (MaRs), 346

Old-growth forests, 160
Optimal harvesting strategy, 156
Optimal weighting, 70
Ordinary least squares estimator (OLS estimator), 256
Outcome equation, 207
Over-the-counter market (OTC market), 294
Overlaping portfolio of consumer loans, 320–326

Pairwise stability, 89, 96, 120–121
Pairwise stable networks, 97–98
Pareto efficiency, 87
Pareto efficient network, 98–99, 107
Payment system, 305–306
Payments Canada Financial Institution File, 178
  geographic concentration, 178–179
  industrial concentration, 179
Peer effects model, 4
Penalization parameters, 334
Physical bank branches, 175
Polytope, 127–128
Pooled LASSO estimator, 32

Portfolio
diversification, 327
similarity, 320, 329*n*7
Post-crisis, 363
Posterior inference, 209
Gibbs sampling of parameters of interest, 210–212
likelihood and conditional posterior distributions, 210
priors, 209–210
Pre-crisis, 363
Predicted type shares, 122
Preference classes, 122
Priors, 209–210, 224
Probability, 93–94
of adjacency matrix, 71
PRT approach, 112–113, 120, 122
Pseudocode of financial contagion model, 292

Quadratic programing problem (QP problem), 112, 123, 127–128
Quantile regression, 334–339
Quasi-Maximum Likelihood Estimator, 301

R software, 336
Racial segregation, 111–112
Real GDP, 335
Real Time Gross Settlement Payment System (RTGS Payment System), 305
Recapitalizations, 336
Recession
FRM as predictor of, 356
probabilities provision, 336
probability indicators, 335
Recursive methods, 146
Recursive solution via method of dynamic programing, 153 (*see also* Stochastic dynamic programing)
assumptions concerning economic and physical environment, 153–154
Bellman's equation, 155–156
solution strategy, 154–155
Reflection problem, 28
Regenerative, optimal-stopping problem, 154
Regional distribution center (RDC), 237
Regional distribution point (RDP), 237
Regression
results, 193–200
tree analysis, 119
Rent extraction, 149–150
Repayment schedule, 318
Researcher utility, 116
Residential loan, 328
Ridge regression, 257
Robustness, 188
Royal Bank of Canada (RBC), 179

Sample
moment equation, 66
selection, 62–63
Secondary FIs, 316
Secured loans, 318
Selection equation, 207
"Shadow banking system", 363
Shapley value, 88
Simulation parameters, 272
Single note inspection data, 237
institutional background, 237
sample description, 241–243
structure of IMS data set, 238–241
Site heterogeneity, 150
Site index, 168*n*9
